Model Name
Dermatitis, Contact, Croton Oil-Induced

Item Number
554510

Introduction
Croton oil-induced mouse ear edema and inflammation is due to the activation of phospholipase A2, which releases arachidonic acid from the cell membrane. The croton oil-induced mouse model is commonly used with the in vitro phospholipase A2 assay to study the mechanisms of skin inflammation and the therapeutic efficacy.

Procedure Summary
Male ICR mice weighing 22 ± 2 g are used. Croton Oil (4% in 20 µL acetone) is applied topically to the anterior and posterior surfaces of the right ear. Test substances and the vehicle (20 µL/ear) are topically administered 30 minutes before and 15 minutes after croton oil challenge. Ear swelling is measured by a dial thickness micrometer gauge at 6 hours after croton oil application. Ear edema is calculated by subtracting the thickness of the left ear (normal control) from right ear (treated ear) as an index of inflammation. Percentage inhibition is calculated according to the formula: (Ic – It)/Ic x 100, where Ic and It refers to the increase of ear thickness (mm) both in the control and treated animals. One-way ANOVA and Dunnett’s test are applied for comparison between treated and vehicle control groups. Significance is considered at p<0.05.

Suggested Testing
• n=6/group (study design dependent)
• Doses may be administered TOP, PO, IV, IP, and SC
• Assessments available: Body weight, Ear thickness, Ear weight, Biomarker analysis (protein or mRNA) and Histopathology

Turnaround Time(s)
• Acute Assay: In-Life completion in 2-4 weeks from sample receipt
• For Subacute Assays: 6 weeks to 3 months

555010 – Dermatitis, Contact, Phorbol Ester-Induced - Mouse
554310 – Dermatitis, Contact, Capsaicin-Induced - Mouse
555510 - Dermatitis, Contact, Oxazolone-Induced - Mouse

Modified Protocols
We will readily accommodate client-specified alterations.

Laboratory
These assays are performed at our AAALAC accredited laboratory in Taipei.

Animal Welfare
All aspects of this work are performed in general accordance with the Guide for the Care and Use of laboratory animals (National Academy Press, Washington, DC, 2011). The study protocol was approved by the Pharmacology Discovery Services IACUC and is performed with the oversight of veterinarians to assure the humane treatment of laboratory animals.

Reference Compounds
Acetaminophen, Aspirin, Dexamethasone, Hydrocortisone, Ibuprofen, *Indomethacin, Phenidone
